PERSONAL INFORMATION

Work authorisation: **Danish permanent residence permit**

Languages:

- **English** (professional)
- **Danish** (professional)
- **Indonesian** (native)

TECHNICAL SKILLS

- **Programming:** Python, .NET, Java, F#, TypeScript, Haskell
- **Web:** React, HTML, CSS, REST APIs
- **AI/ML:** machine learning, AI-assisted coding, and agentic workflows
- **Backend:** FastAPI, API design, Python tooling, code analysis
- **Databases and cloud:** MySQL, Azure, cloud-based app development
- **Software engineering:** Git, testing, debugging, documentation, requirements
- **Tools:** UI/UX, interaction design

PROFILE SUMMARY

Recent MSc graduate in Computer Science from the University of Copenhagen with an interest in software development, web applications, backend logic, AI and machine learning, and user-centred digital tools. Through academic projects, I have worked with full-stack development, API-based workflows, database integration, code generation, AI-assisted coding workflows, and software engineering. I enjoy translating complex technical workflows into practical systems that are understandable, reliable, and useful for real users.

As a colleague, I am curious, structured, responsible, and motivated by learning from others while contributing with clear communication and positive energy.

EDUCATION

MSc in Computer Science, University of Copenhagen
Sep 2024 – Jun 2026

- Built advanced competencies in software development, algorithms, computer systems, program analysis, user interface technology, machine learning, artificial intelligence, and collaborative technologies.
- Worked with programming concepts, performance-oriented systems thinking, static analysis, interface design, prototyping, and evaluation of user interface tools.
- Completed a thesis on an interactive web interface for the Fabrication Experiment Design Tool, combining frontend development, backend analysis, and code generation.

BSc in Computer Science, University of Copenhagen
Sep 2021 – Jun 2024

- Developed a strong foundation in algorithms and data structures, databases, software development, computer systems, programming languages, interaction design, and mathematical analysis.
- Worked with cloud-based app development, database integration, requirements, testing, and user-centred design through coursework and project work.
- Completed a bachelor project on a task list application for nursing home caregivers using DCR Graphs, combining workflow modelling, software engineering, and UX design.

VOLUNTARY EXPERIENCE

Tutor Volunteer, University of Copenhagen

Aug 2024

Helped introduce new students to university life by organizing social activities and supporting their integration into the student community. Strengthened communication, facilitation, and collaboration skills in a student-facing role.

WORK EXPERIENCE

Sales Assistant, COOP

Sep 2020 – Jan 2024

Assisted customers and handled daily store operations alongside university studies. Developed responsibility, service-minded communication, and the ability to explain practical issues clearly to different people.

INTERESTS

I enjoy board games, game design, and building small applications that solve everyday problems. I also like working on projects where software, usability, and practical workflows meet.

SELECTED PROJECTS

INTERACTIVE WEB INTERFACE FOR FEDT

MSc Thesis

- **Purpose:** Made the Fabrication Experiment Design Tool easier to configure and understand through a visual web interface for experiment workflows.
- **Methods and technologies:** React, TypeScript, Blockly, FastAPI, Python code generation, and AST-based backend analysis.
- **Result:** Designed and implemented a configurable editor that connected visual blocks with executable Python specifications, helping reduce the need to work directly with complex code structures.
- **Relevant competencies:** Full-stack development, frontend/backend integration, code generation, structured debugging, documentation, and user-focused software design.

TASK LIST APPLICATION FOR NURSING HOME

BSc Project

- **Purpose:** Explored how a digital task list could support nursing home caregivers by making tasks, roles, and workflows easier to follow during daily care work.
- **Methods and technologies:** DCR Graphs, cloud-based development, database integration, workflow modelling, software engineering, and user experience design.
- **Result:** Developed a proof-of-concept application that translated care-related workflows into a structured digital tool with role-aware task handling.
- **Relevant competencies:** Requirements understanding, database-backed development, domain modelling, user-centred design, and communication with non-technical users.

COLLABORATIVE TECHNOLOGIES PROJECT

University Project

- **Purpose:** Investigated how people coordinate work across physical and digital artefacts in hybrid collaborative settings.
- **Methods and technologies:** Qualitative observation, interviews, video-based analysis, prototyping, and interaction design methods.
- **Result:** Identified challenges around awareness, communication, and shared understanding between participants, and used these findings to inform prototype ideas.
- **Relevant competencies:** User research, problem framing, analysis of workflows, teamwork, and explaining complex interaction problems clearly.

WEBSITES AND SMALL APPLICATIONS

Personal Projects

- **Purpose:** Built small tools and websites to practise software development and communicate projects in a clear and accessible way.
- **Methods and technologies:** React, TypeScript, HTML, CSS, Git, GitHub Pages, and iterative development.
- **Result:** Designed and developed a personal portfolio website and smaller web applications for personal and promotional use.
- **Relevant competencies:** Web development, UI structure, deployment, self-directed learning, and turning ideas into working prototypes.

ADDITIONAL TECHNICAL FOCUS

- **Software development:** Experience building applications where frontend, backend, data handling, and user workflows need to fit together.
- **User-centred systems:** Strong interest in making technical workflows easier to understand for real users, especially where usability and practical work processes matter.
- **Learning and adaptability:** Comfortable entering new codebases, learning unfamiliar technologies, asking clarifying questions, and improving solutions iteratively.
